The service

Optical and Radar systems

Optical

**Synthetic Aperture Radar
(SAR)**

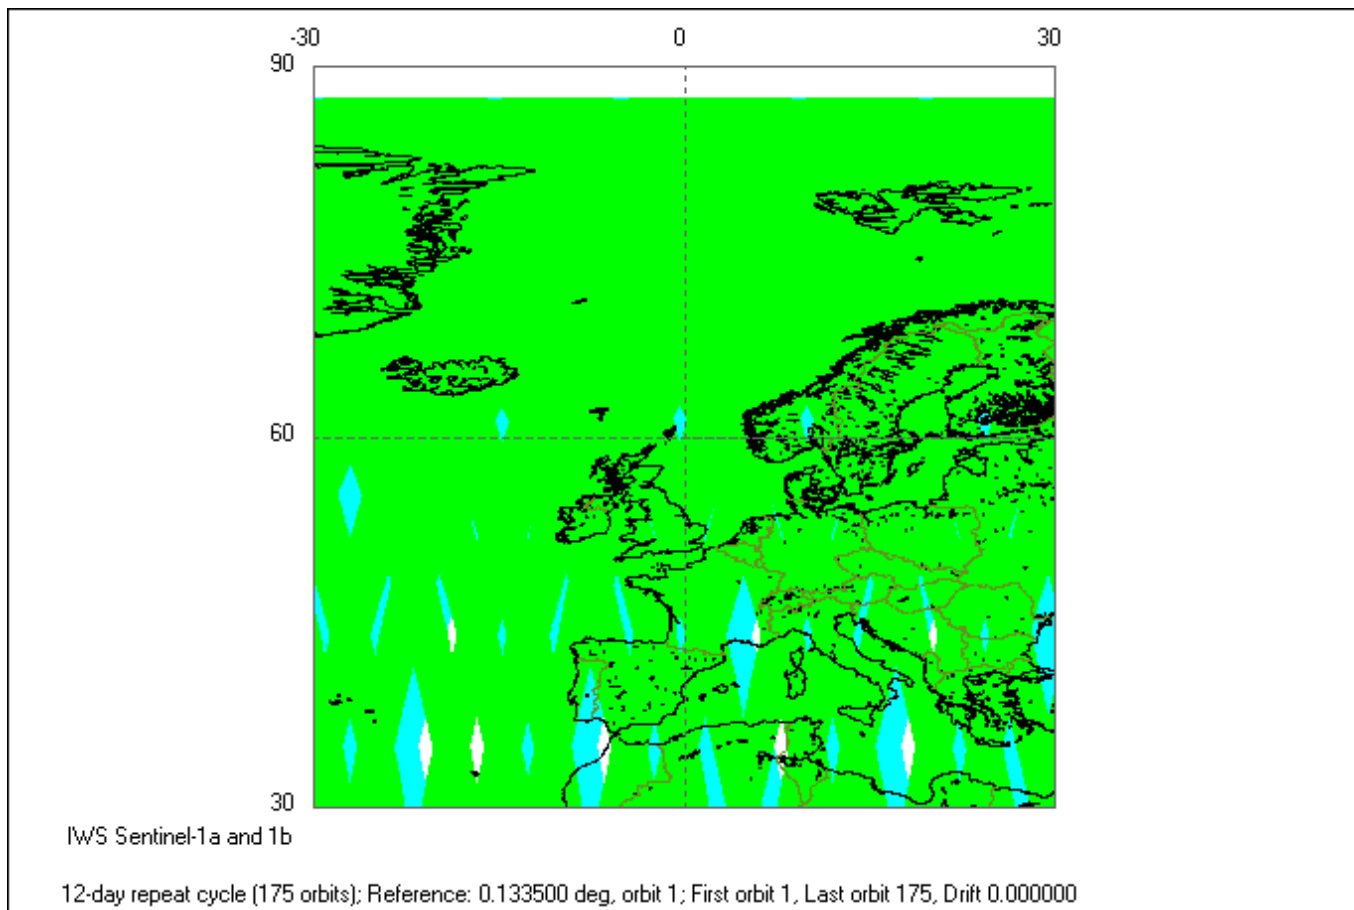

Free of charge satellite **optical** and **radar** data

Landsat-5	1985-2012	30m	global coverage
Landsat-8	2013	30m	global coverage
Sentinel-1A	2014	20m	global coverage
Sentinel-1B	2016	20m	global coverage
Sentinel-1C/1D	2020	20m	global coverage
Sentinel-2A	2015	10,20m	global coverage
Sentinel-2B	2016	10,20m	global coverage
Sentinel-2C/2D	2020	10,20m	global coverage

Satellite **free of charge** data are ensured until 2030

Sentinel-1A/B

Global coverage every 6 days (1A & 1B) at a resolution of 20 meter

Service infrastructure

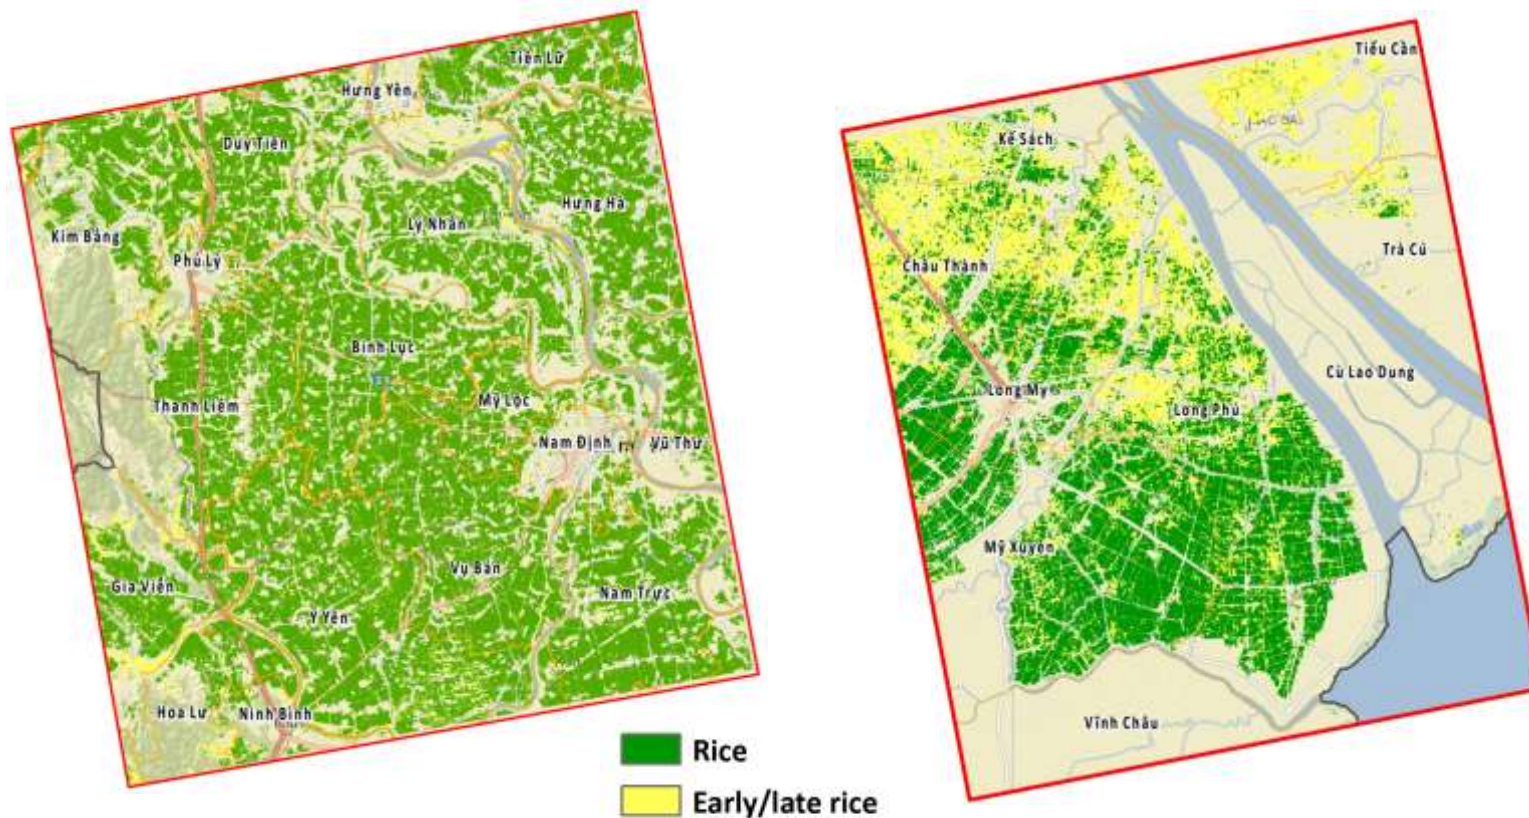

All **Earth Observation** data are transferred, stored, processed and analyzed on the cloud.

All **field data** collected by mobile phone, sent to the cloud over mobile or Wi-Fi network.

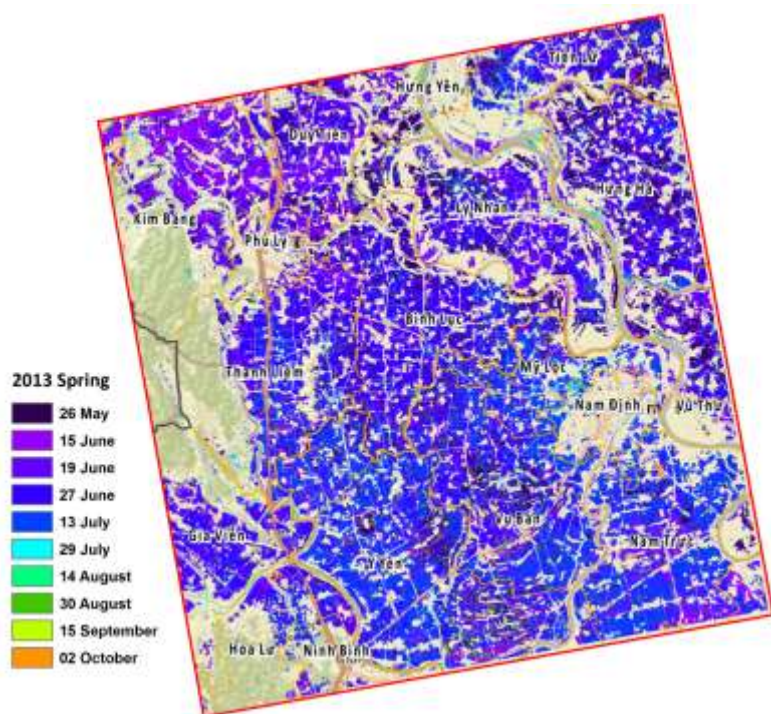

Users **access information via a web-based** platform from any internet enabled device.

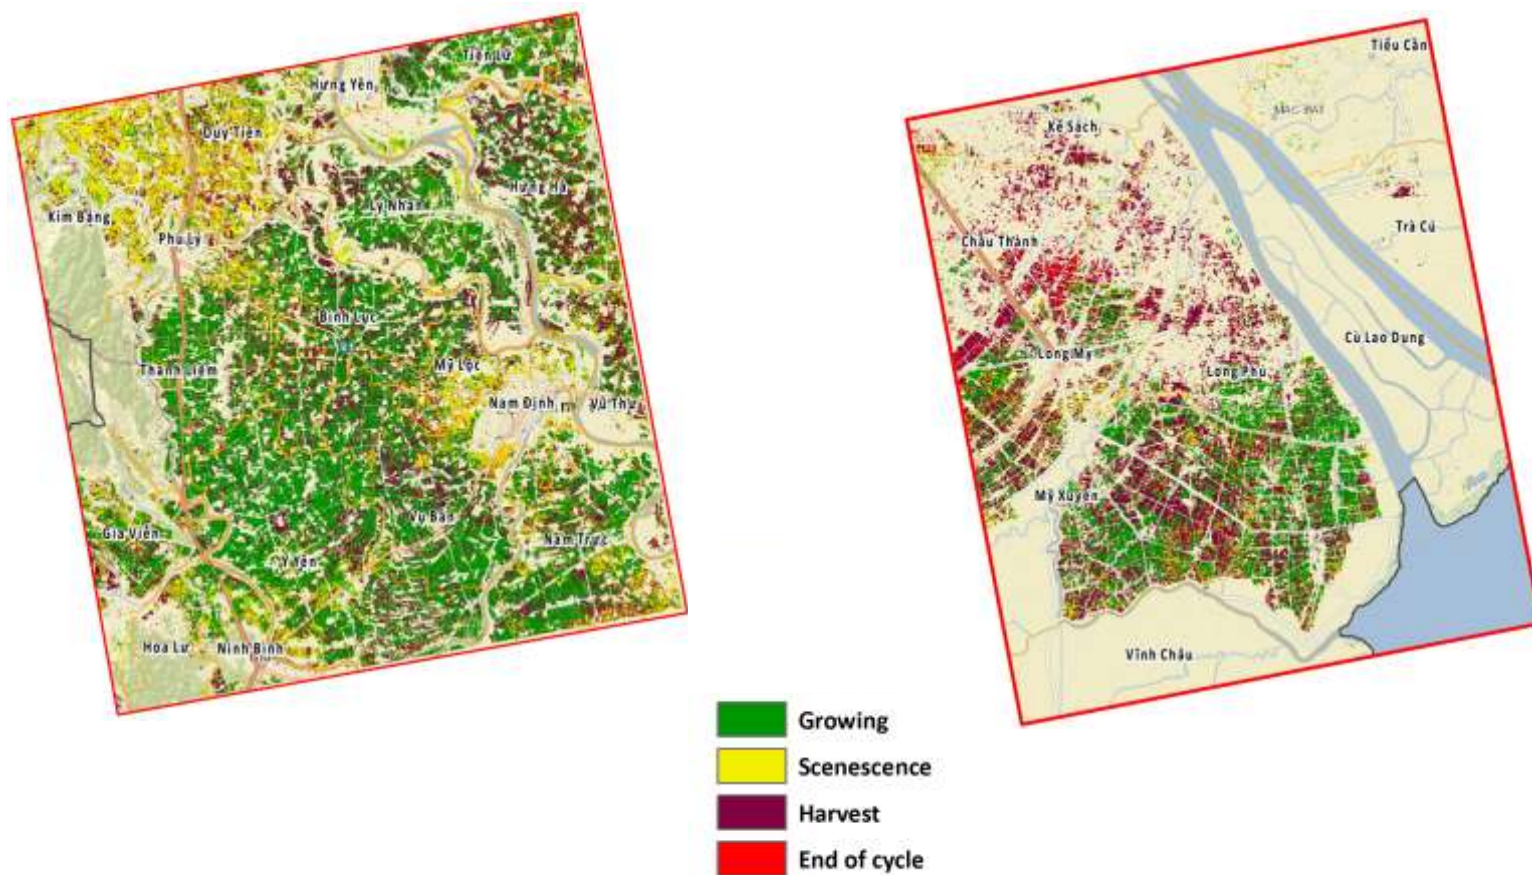

Seasonal rice area – Red and Mekong River Delta, 2013

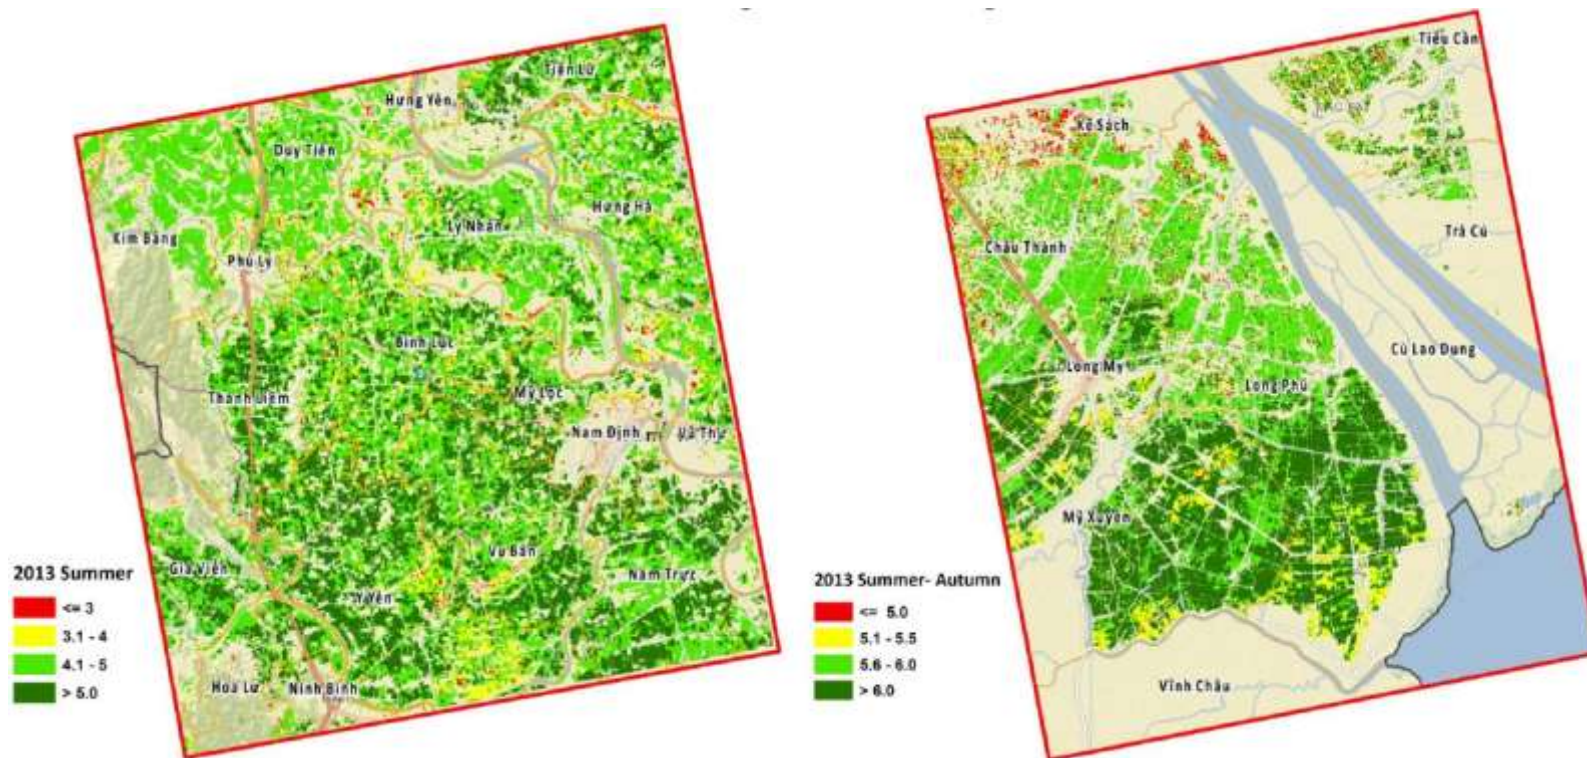

Start of season – Red and Mekong River Delta, 2013

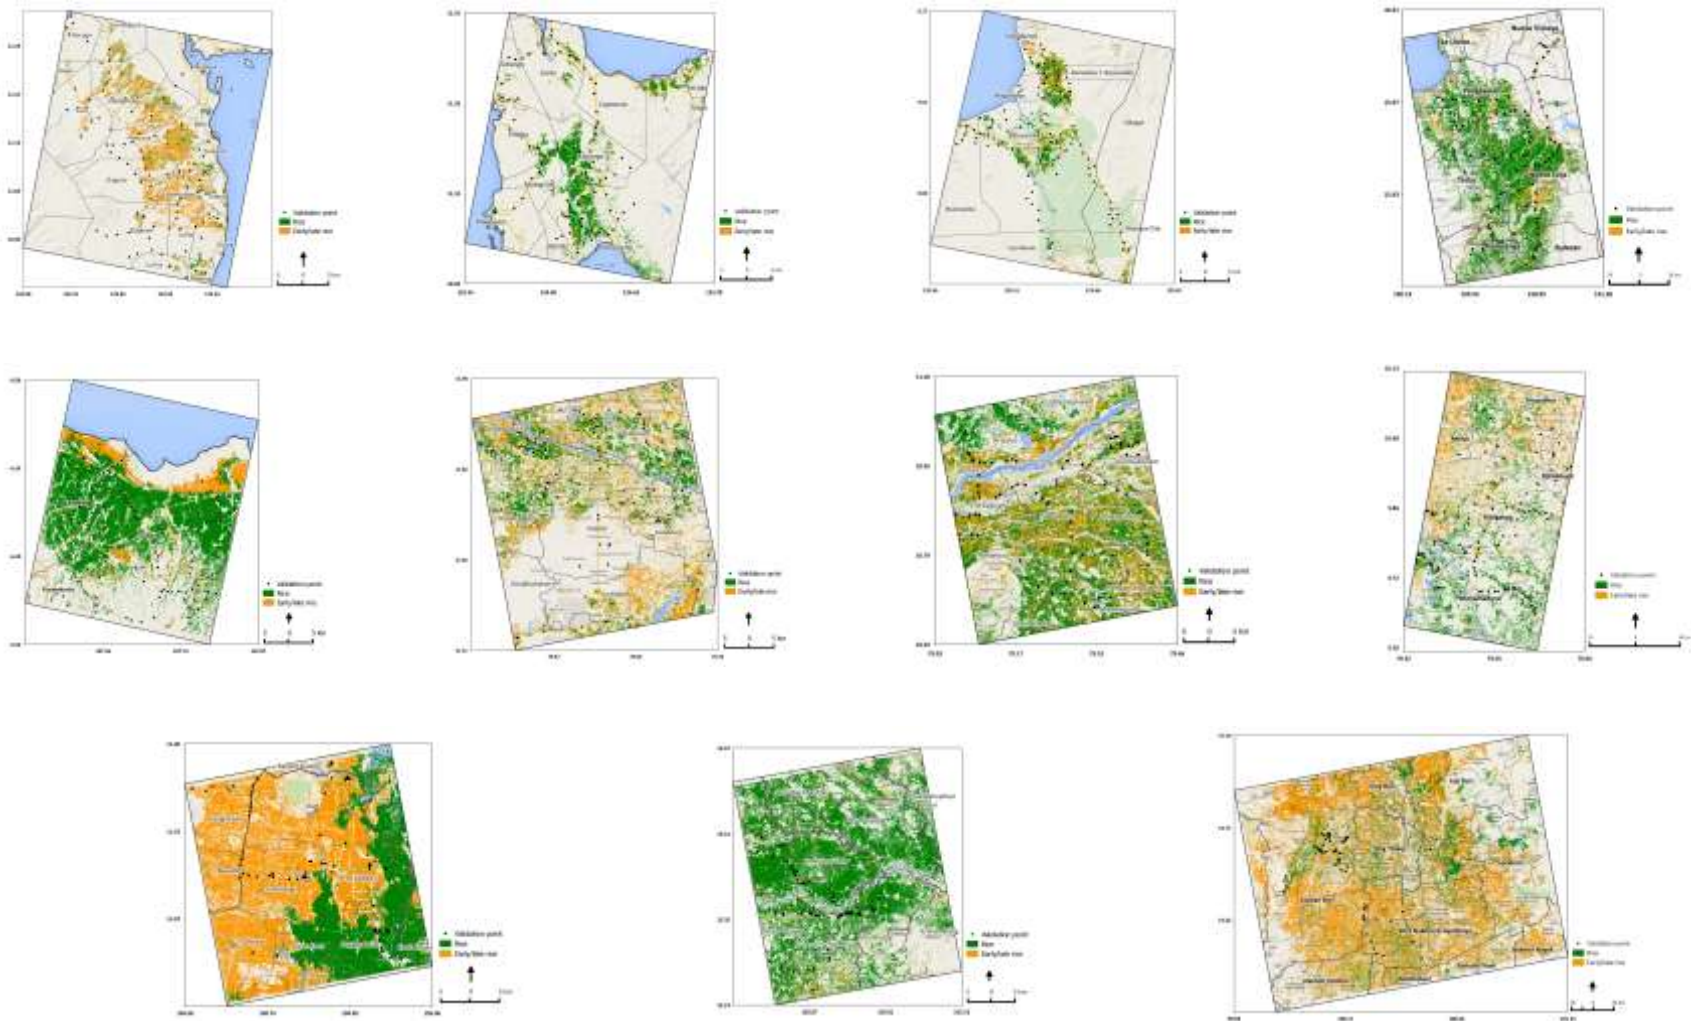

Seasonal rice dynamics – Red and Mekong River Delta, 2013

How much yield – Red and Mekong River Delta, 2013

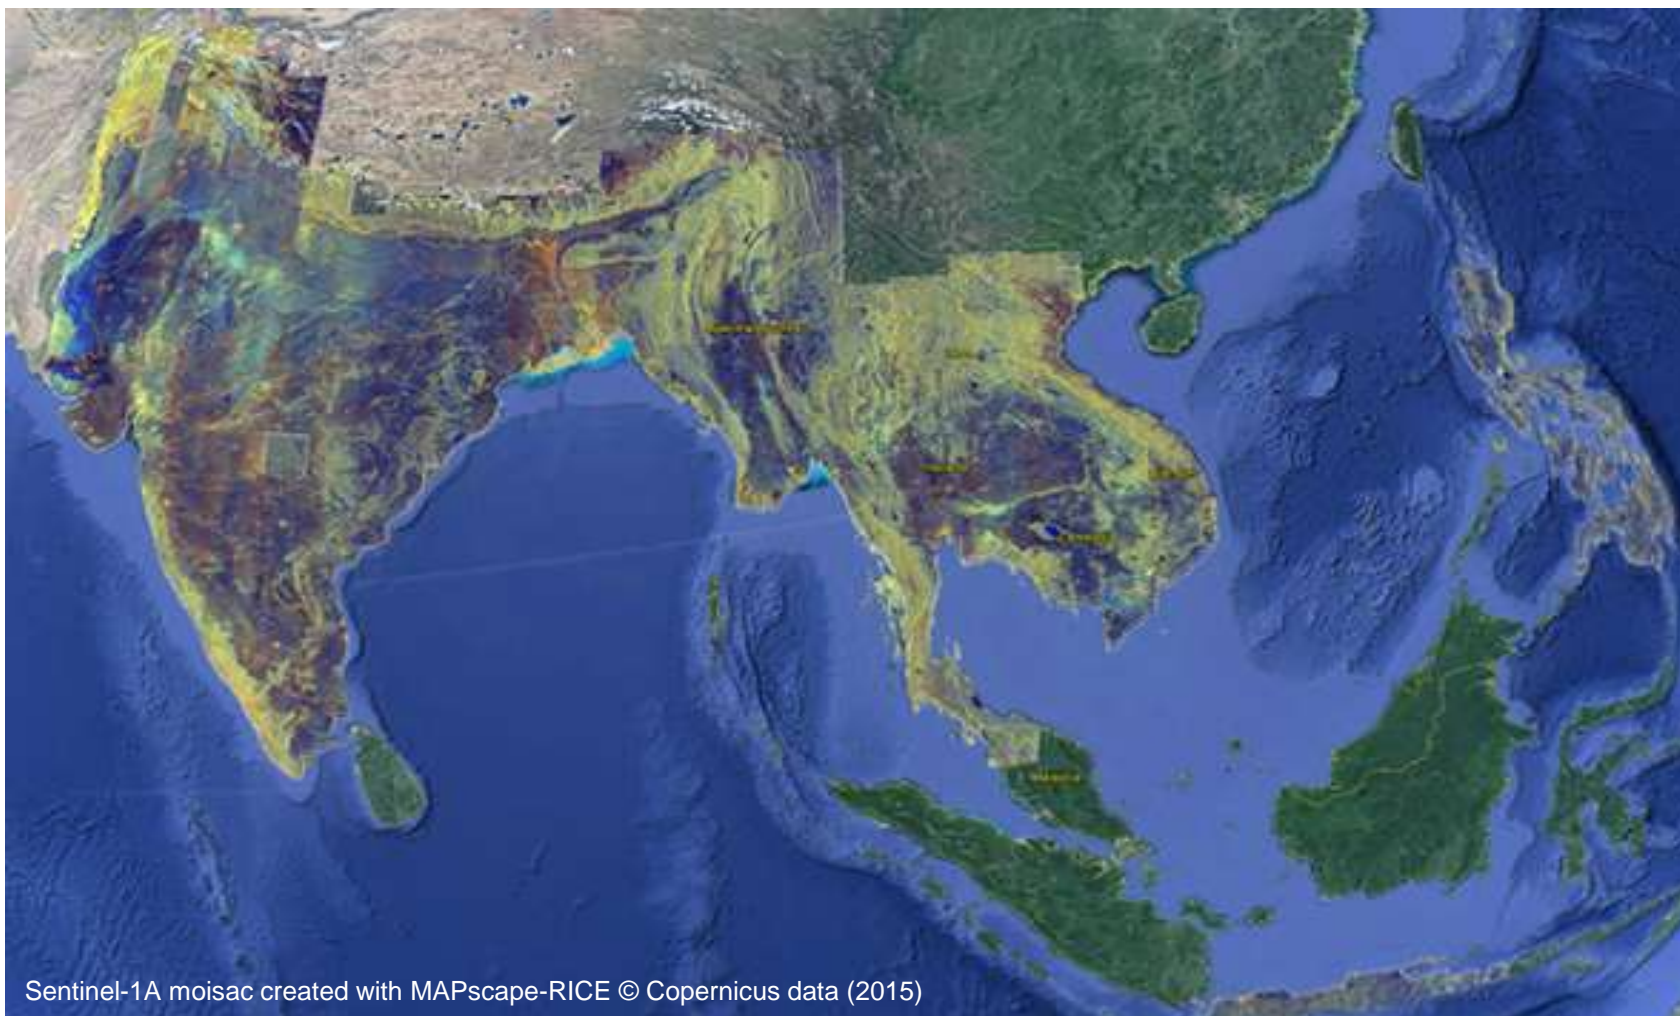

Rice area – Philippines, Java, Tamil Nadu, Cambodia, Thailand

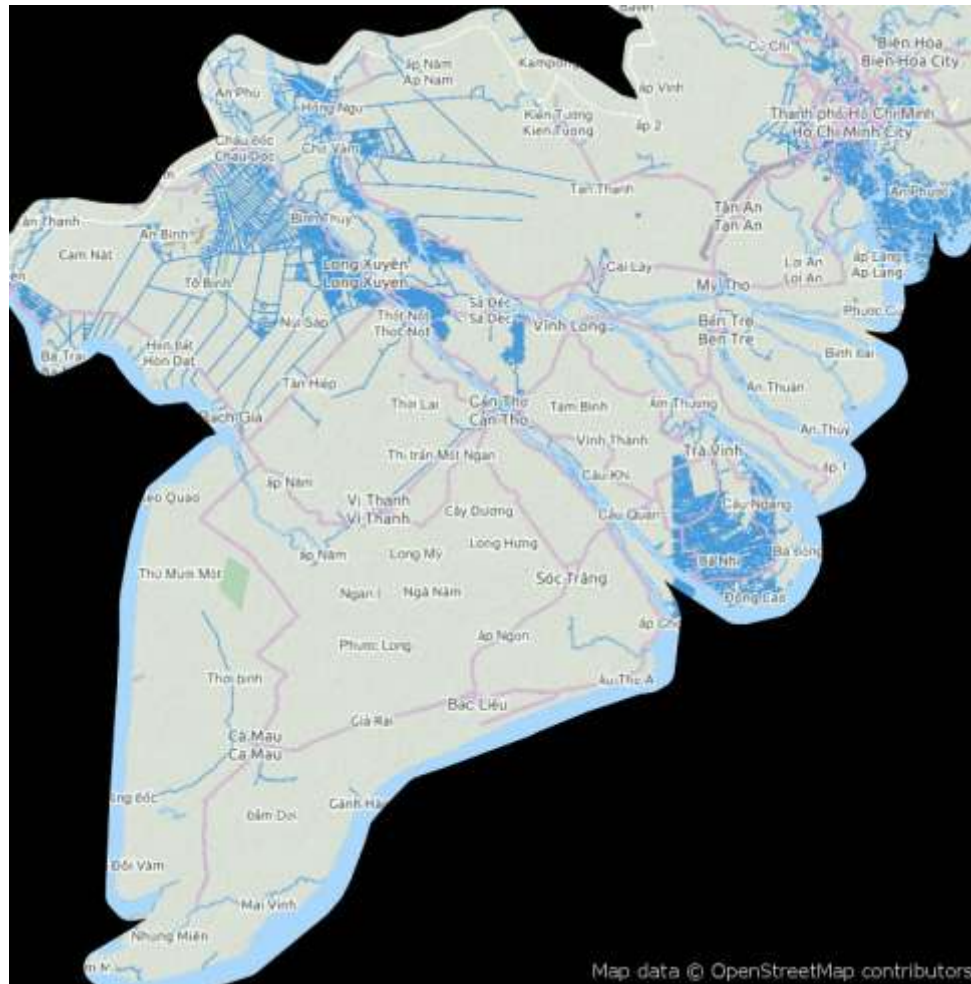

National scale RIICE products (1ha) based on ENVISAT ASAR

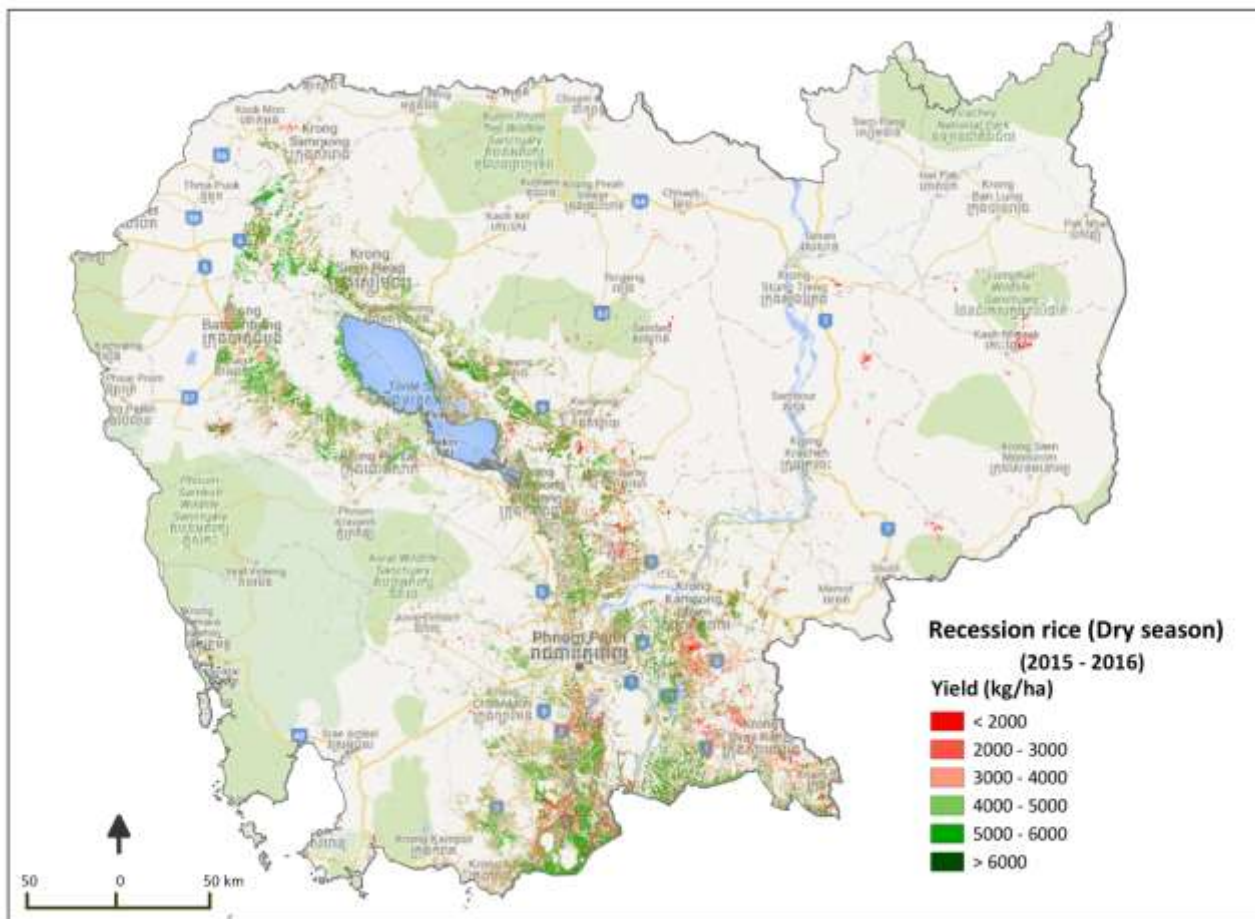

Sentinel-1 – National to continental scale

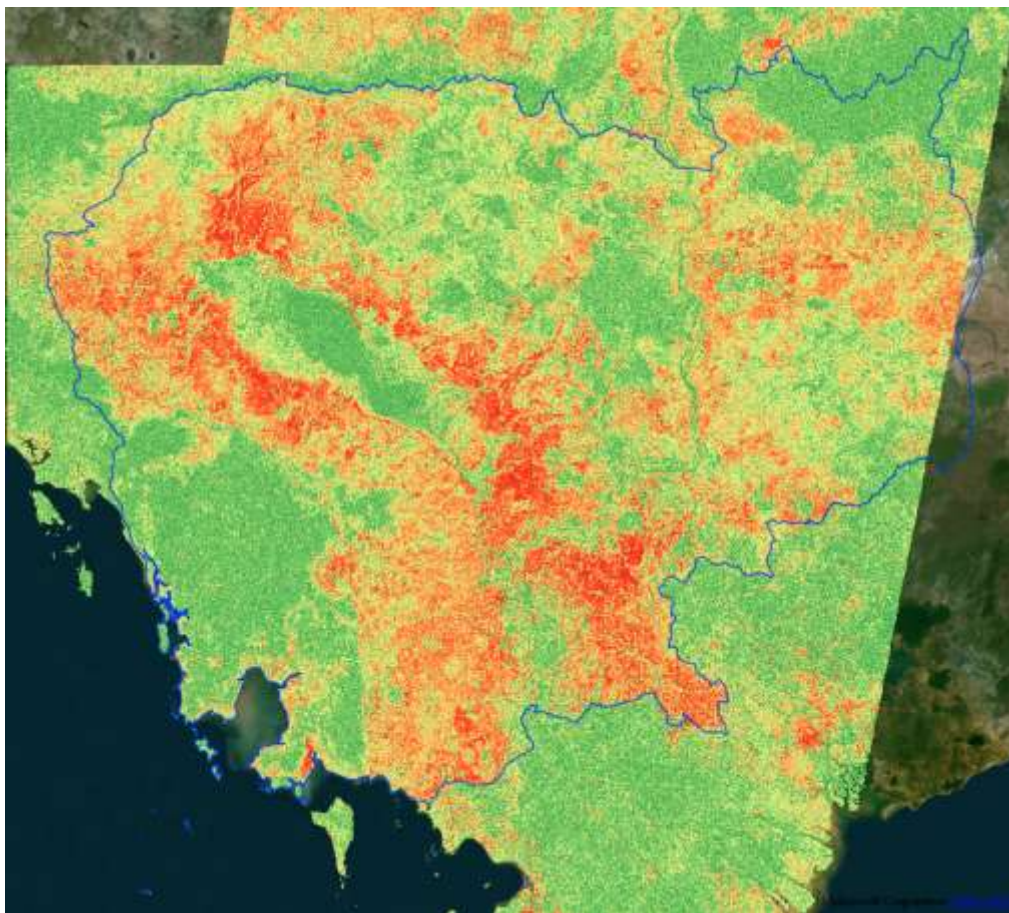

Sentinel-1 – 12-days monitoring at large scale

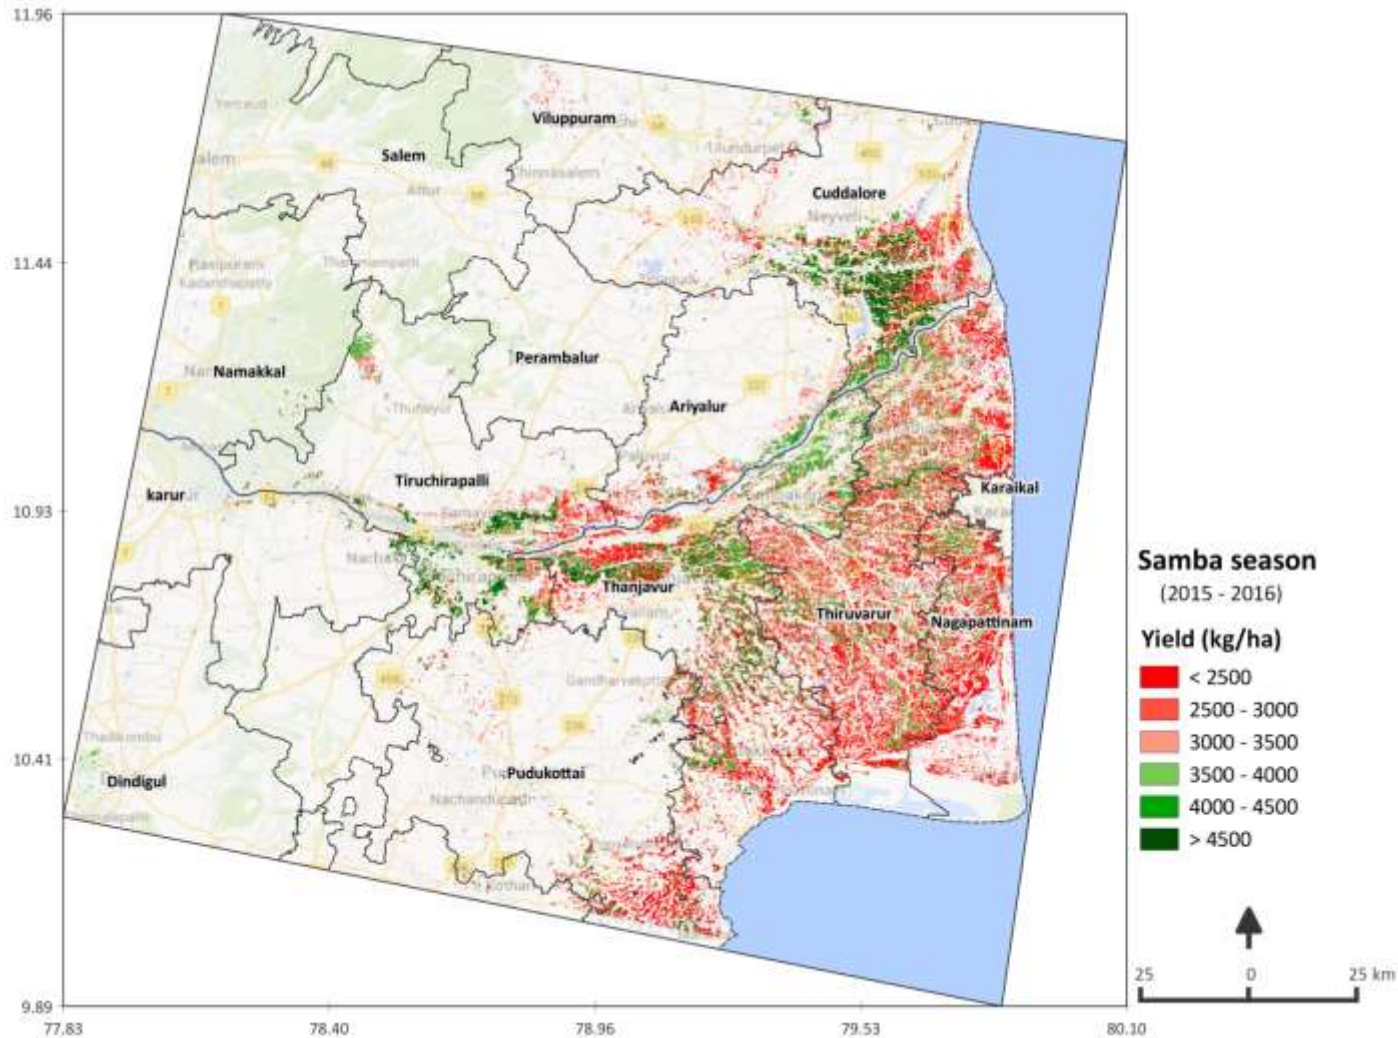

Cambodia – Dry season 2015-16

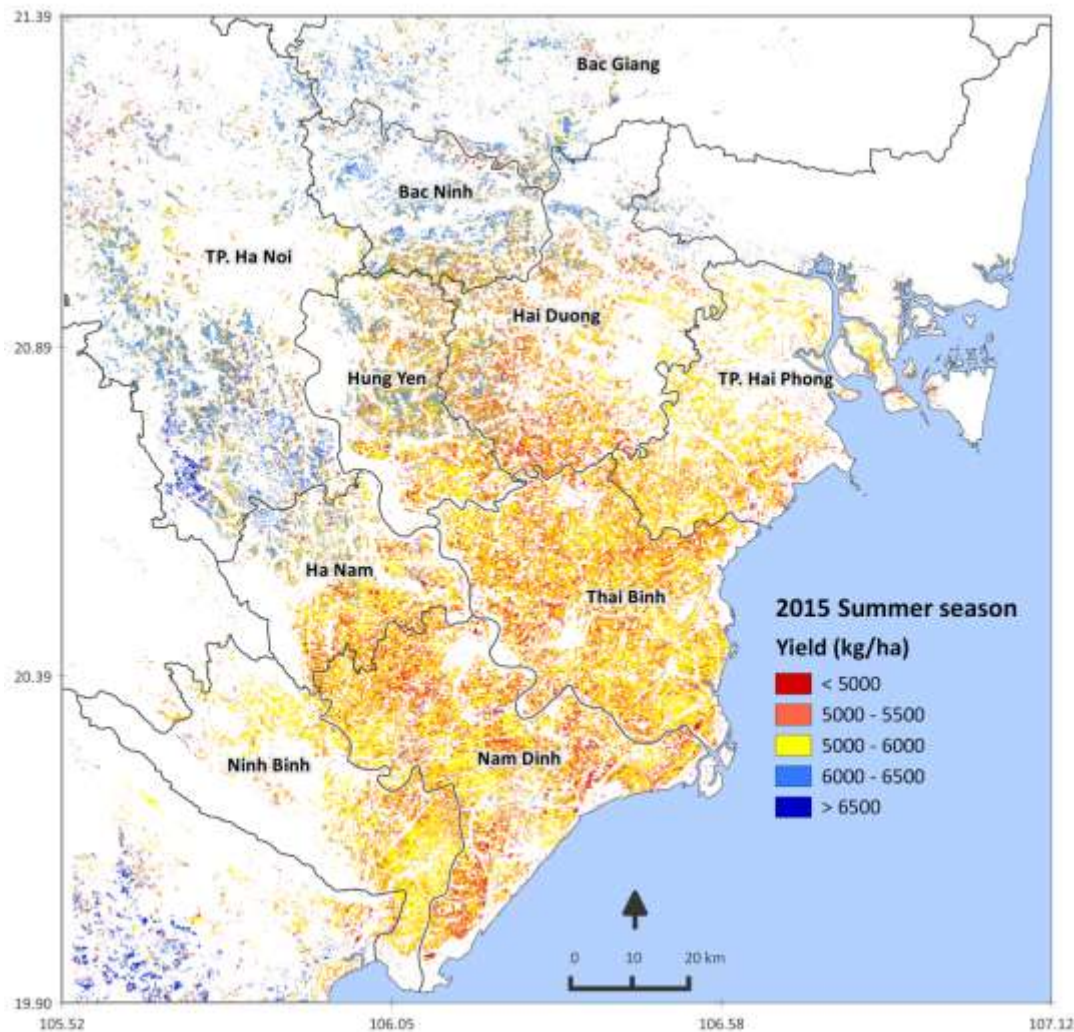

Cambodia – Early Wet Season 2016 – April Drought

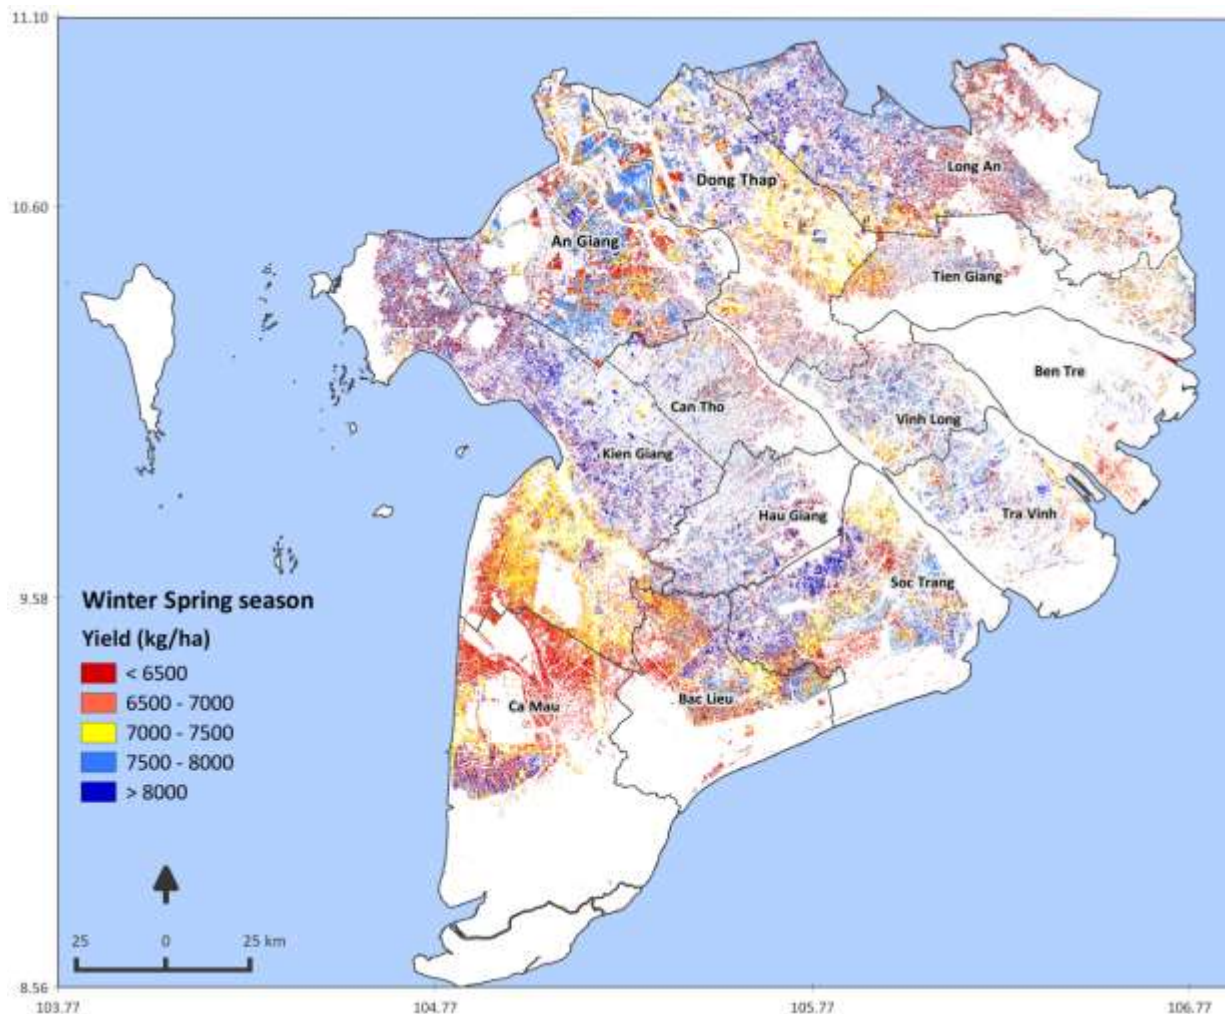

Tamil Nadu – Samba season 2015-16

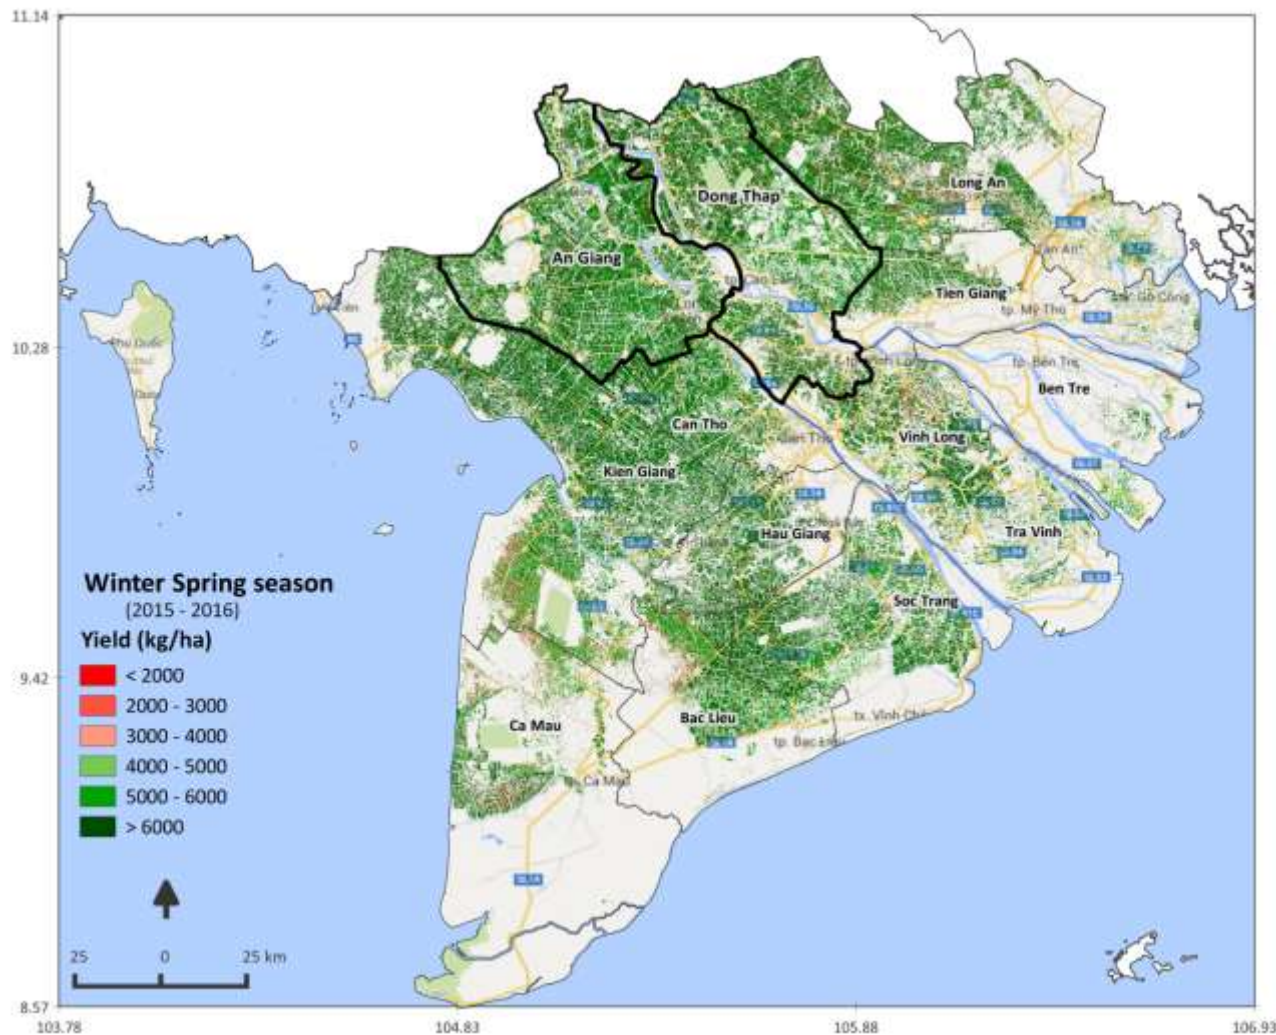

Red River Delta – Summer season 2015

Mekong River Delta – Winter Spring season 2014-15

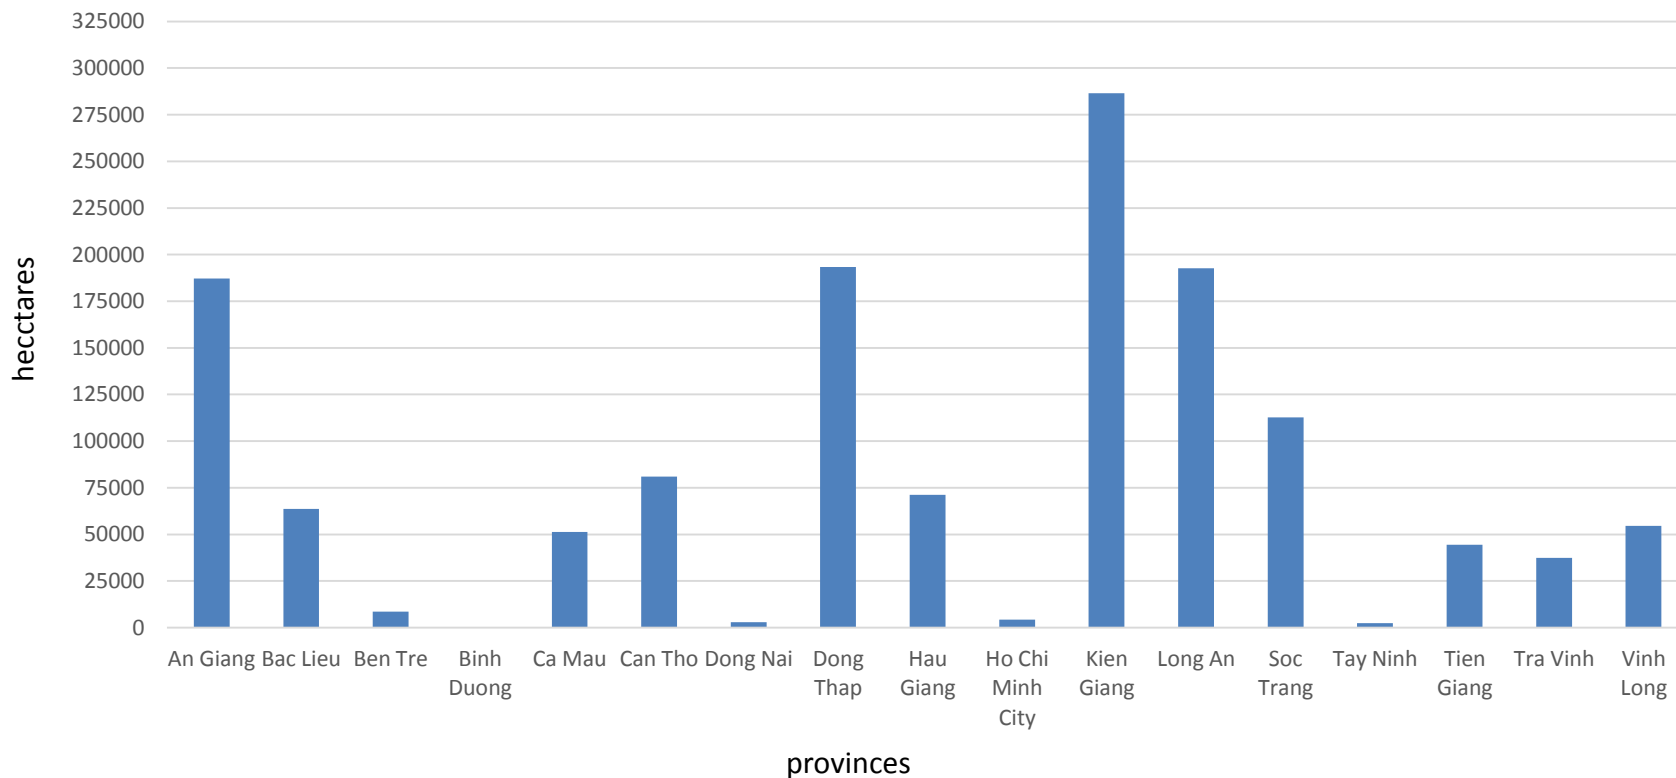

Mekong River Delta – Winter Spring season 2015-16

Mekong River Delta – Winter Spring season 2014-15

Mekong River Delta – Winter Spring season 2015-16

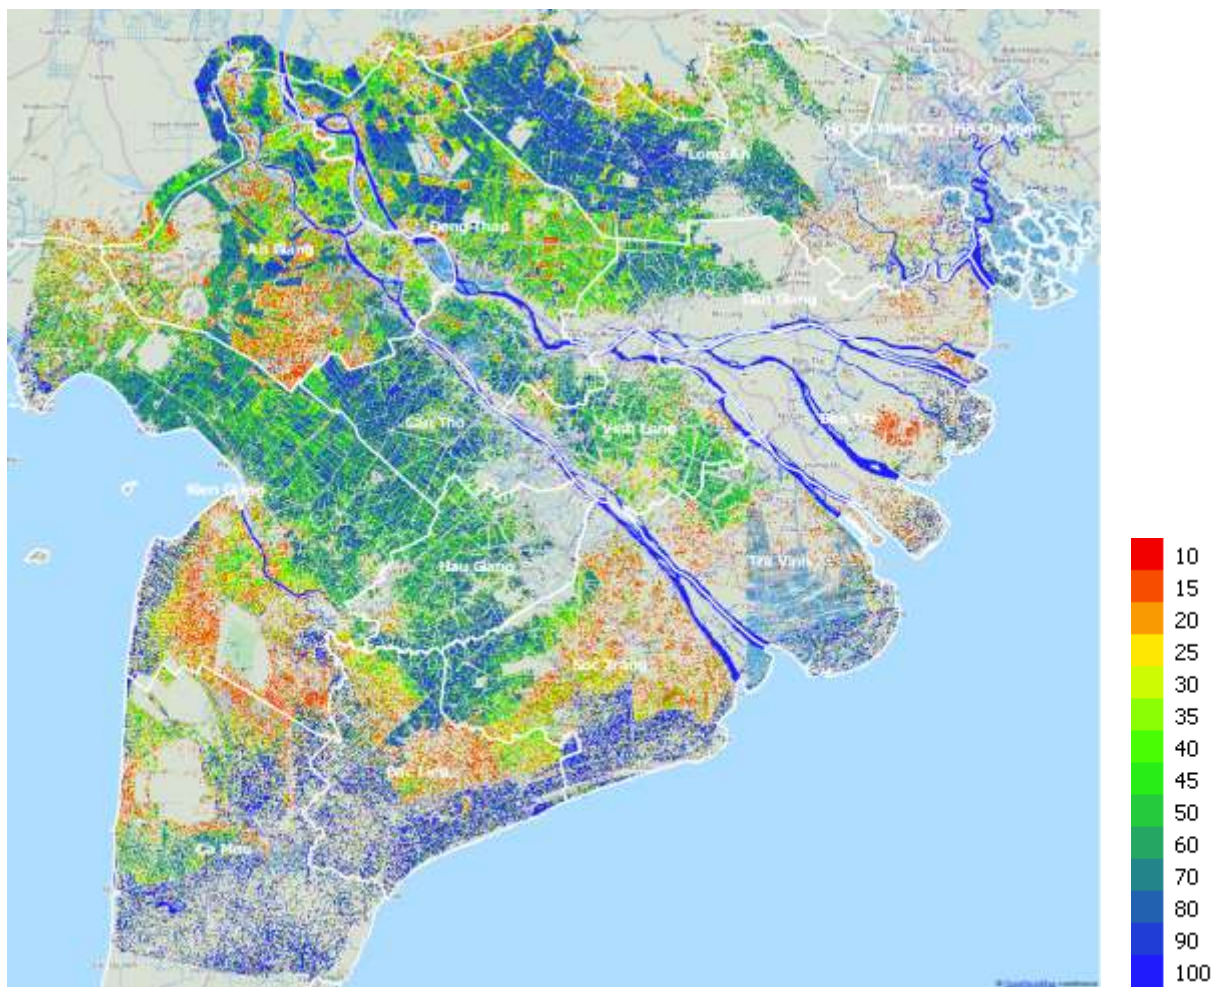

Difference of around 7%

Mekong River Delta – Winter Spring season 2014-15 vs 2015-16

Start of Season – Percentage of rice planted for An Giang province

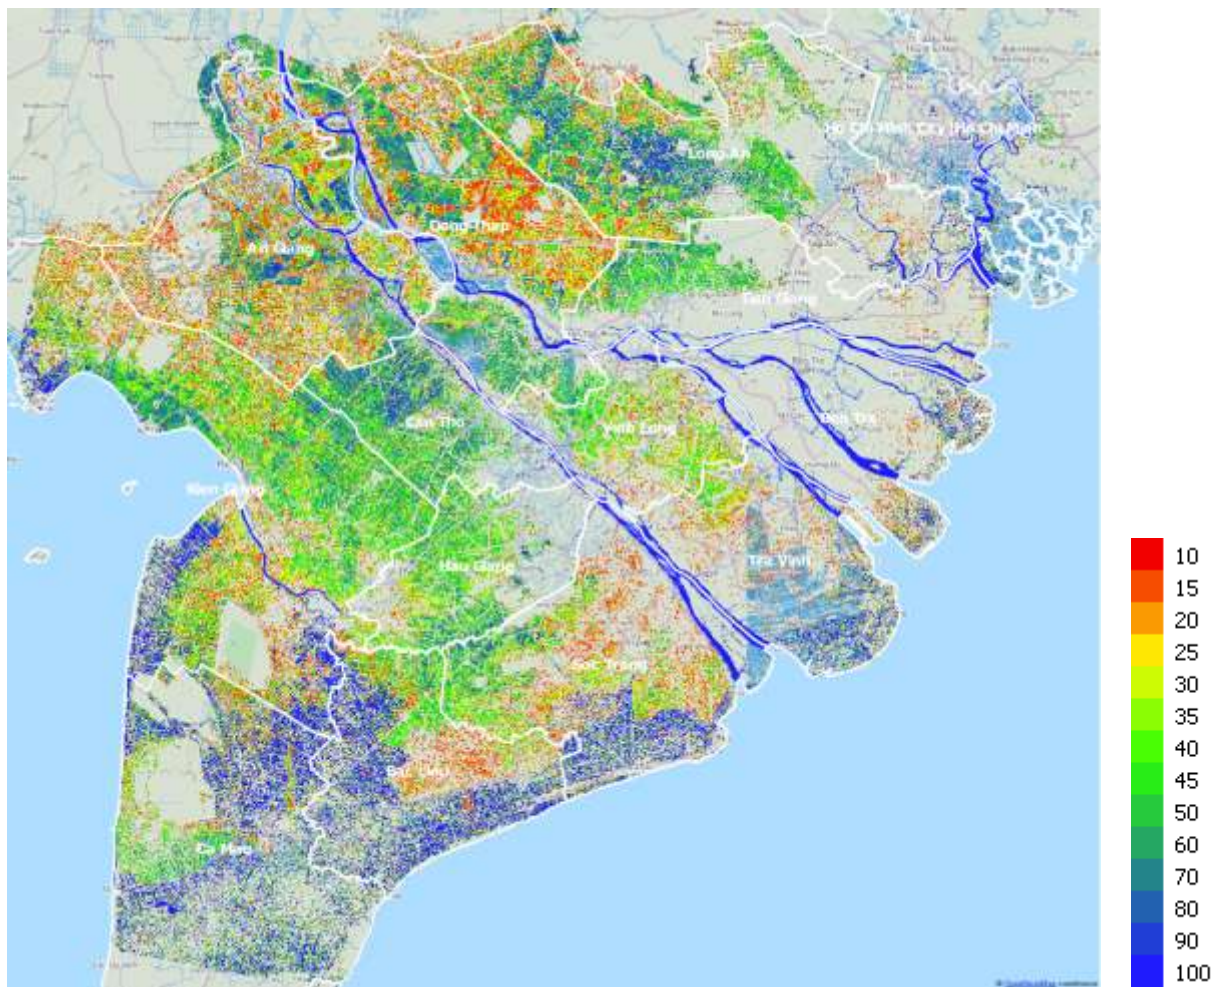

Mekong River Delta – Winter Spring season 2014-15

water detected on the ground (in percentage)

Mekong River Delta – Winter Spring season 2015-16

water detected on the ground (in percentage)

Satellite images map rice damage from typhoon

on 26 November 2013.

Satellite images (*click image on the right for more maps*) showing flooded rice farms and buildings that were damaged by Typhoon Haiyan (local name Yolanda) in the northeastern part of Leyte Province have been released as part of ongoing work to track rice production in the Philippines.

The satellite-generated maps, developed by the International Rice Research Institute in collaboration with [sarmap](#) and the [Department of Agriculture-Philippine Rice Research Institute](#) (DA-PhilRice), show that flooding has affected about 1,800 hectares of standing rice crop across 15 municipalities and that the typhoon badly damaged buildings where harvested rice may have been stored.

Municipality	Rice area	Flooded area
Alangalang	3,079	939
Albuera	58	2
Burauen	570	124
Dagami	1,757	681
Dulag	1,055	370
Jaro	400	14
Julita	1,017	140
La Paz	209	17
Mayorga	395	199
Ormoc City	0	1
Palo	2,104	402
Pastrana	1,427	71
San Miguel	711	611
Santa Fe	1,715	781
Tabontabon	861	227
Tanauan	1,628	1,545
Tolosa	286	376
Total	17,272	6,501

RIICE remote sensing-based flood assessment helps Government of Tamil Nadu, India in quickly directing flood relief measures

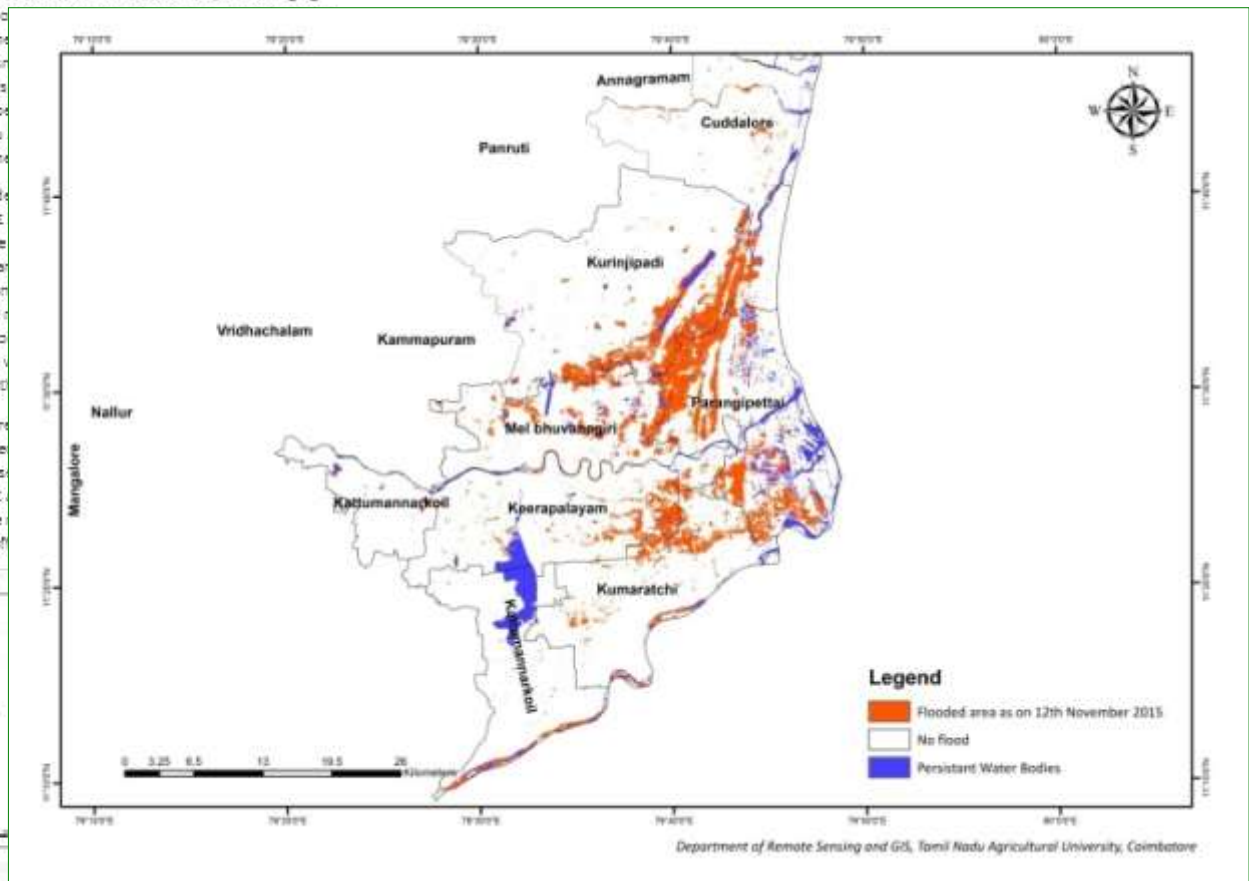

The State Government of Tamil Nadu, India initiated several policy level measures in alleviating the losses in the aftermath of the 2015 devastating floods based on a timely assessment report containing flood maps and statistics provided by the Remote Sensing-based Information and Insurance for Crops in Emerging

Economies (RIICE) project. The report was shared with the Chief Secretary to the Government of Tamil Nadu on 13 October 2015.

heavy rains and subsequent flooding in many districts of Tamil Nadu, India, resulting in the loss of 347 lives in addition to severe damage to agricultural land and infrastructure. The report was delivered as part of the RIICE's flood assessment report was delivered as part of the report by the Vice-Chancellor of the Tamil Nadu Agricultural University, Coimbatore (the flood map below). The report was subsequently shared with the Chief Secretary to the Government of Tamil Nadu on 13 October 2015.

The report initially helped in identifying the flood affected areas and in directing relief measures undertaken by the State Government. Dr. M. Bhaskaran, Special Secretary, Government of Tamil Nadu, Department of Agriculture, Government of Tamil Nadu, highly appreciated the quick delivery and the usefulness of the assessment report provided by TNAU and RIICE. Speaking at a press conference, he explained that the report was used as the basis for providing relief materials such as input, seeds and seedlings to 400 flood affected farmers.

TNAU as a stakeholder in the RIICE project has been monitoring rice crop and estimating yield using satellite data in the Cauvery Delta Region in the state of Tamil Nadu. TNAU has been trained by RIICE parties to acquire and locally process high resolution Synthetic Aperture Radar (SAR) data from different space agencies to obtain the rice area maps and to further link the generated data to a specialized crop growth yield model to generate yield maps. During the current cropping season Sentinel 1A data was acquired from the European Space Agency (ESA) and used for crop monitoring.

Philippines Rice Information System – PRISM

About us

[Home](#) > [About us](#)

The Philippine Rice Information System (PRISM) project aims to develop a monitoring and information system for rice production in the Philippines. PRISM's main purpose is to gather and organize information on rice yield, yield gaps and the causes of these yield gaps, and to provide this information to key stakeholders for policy support. PRISM relies on data from remote sensing, crop models, in-field crop surveys, and other fieldwork to deliver actionable information on rice crop seasonality, area, yield, damage from flood, wind, or drought, and yield-reducing factors, such as diseases, animal pests, and weeds. PRISM is a 4-year R&D collaboration between the Philippine Department of Agriculture (DA), Philippine Rice Research Institute (PhilRice), International Rice Research Institute (IRRI), and sarmap.

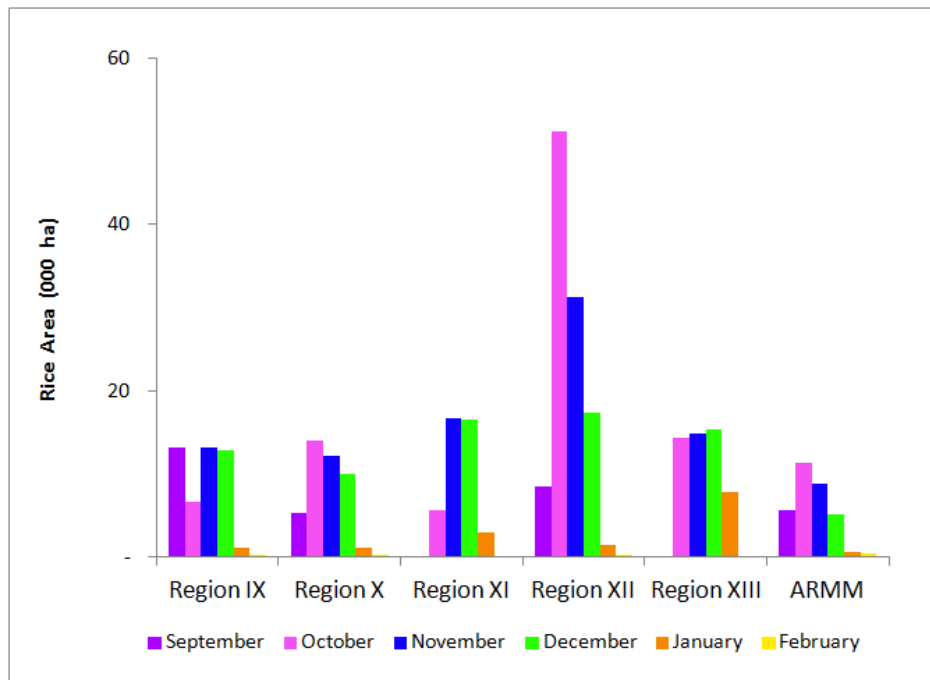

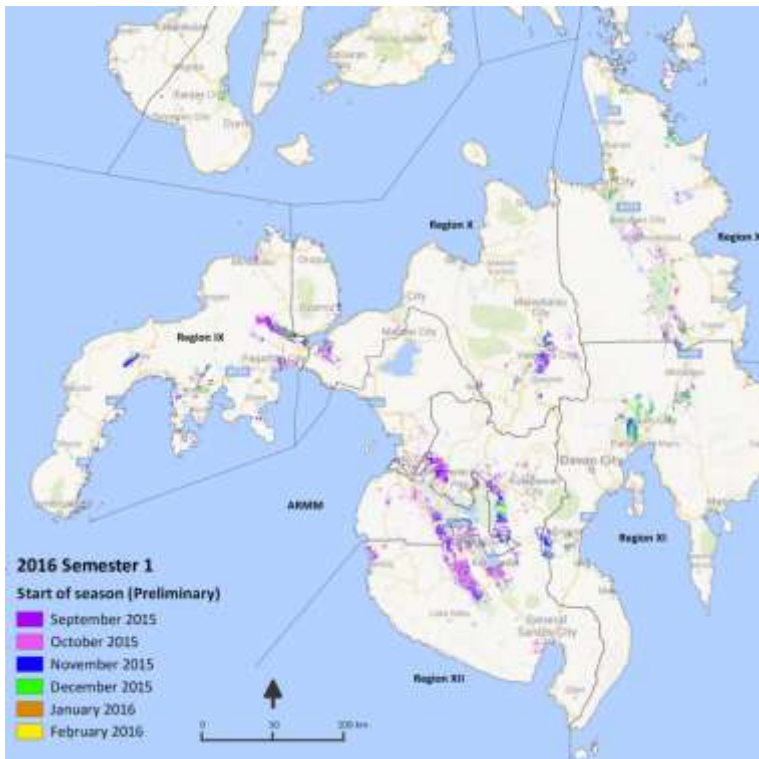

PRISM – Rice Area

in 000 ha

Region	2015, 2 nd sem	2016, 1 st sem*
CAR	64,092	32,923
Region I	227,083	152,695
Region II	316,497	202,676

Region XIII	59,248	52,267
ARMM	57,275	31,712

PRISM – When planted?

reveals heterogeneity in planting

PRISM – Yield

in tons/ha

Region	PRISM estimate	PSA-BAS estimate
Region IX	4.35	4.23
Region X	4.80	4.58
Region XI	4.52	4.56
Region XII	4.17	3.83
Region XIII	3.30	3.00
ARMM	2.67	2.80

Capacity building

- Capacity building events in each country every year.
- Capacity building on remote sensing, crop modeling and field activities.
- A total of 50 training courses have been carried out.
- The RIICE service (MAPscape-RICE, Oryza, and field protocol) has all improved thanks to feedback from national partners.

Field work

- Fieldwork is conditio sine qua non.
- It validates the products and provides essential information for improving and extending them.
- It alerts to any problems.
- Consistent field protocols are crucial.

Fieldwork is more expensive than remote sensing

RIICE developments 2011 - 2016

2011-12

Where is rice?

Testing the protocols

Some successes, but also several problems

2013

Revised protocols and reporting – better than 2012, but still room to improve

Google Drive to rapidly share field monitoring data

Better processing of SAR images, better validation of maps, better accuracy

Yield results are very promising in most sites

WebGIS set up to share the results with partners

Rapid response to typhoon Haiyan (Philippines)

Rapid response of floods in Thailand

RIICE developments 2011 - 2016

2014

Development of cloud computing for massive SAR processing

Testing of Smart Phones for field data collection

2015

Use of Sentinel-1A in all countries

Cloud computing for processing Sentinel-1A data is operational

2016

Rapid response of 2015/16 drought in Vietnam

Rapid response of 2016 drought in Cambodia

Sentinel-1A acquisition plan for S/SE Asia optimized with ESA

Launch of Sentinel-1B

Launch of Sentinel-2B in Q2

Conclusions

- Monitoring of agriculture and natural resources with remote sensing is a fast growing development, in particular now where Sentinel data – ensured until 2030 – are freely available.
- Digital information enables a better management and planning of agriculture and natural resources, complement and support field data collection, and reduce costs.

Conclusions

- The availability of **systematic multi-sensor acquisitions is essential** for an operational service in particular for agricultural applications (complementarity and redundancy).
- **Understanding of crop practices and fieldwork validation** are both *conditio sine qua non* (learning and credibility).
- It is essential that **national partners have an active role**, in particular wrt:
 - products acceptance;
 - drivers of education in the country;
 - local expertise;
 - access to field sample data for calibration/validation.

Thank you for your attention
